

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

THE principal object of this Catalogue is to give a complete list of all the Genera and Species of Australian Land Shells known to be described, together with descriptions of such new Species as have not hitherto been recorded in the principal Australian collections—and to record correct localities.

The letters M.C. after the species denote the specimens in my own cabinet.

I take this opportunity of acknowledging the services of Mr. John MacGillivray who has given me much valuable information as to the habitat of the various species.

I feel convinced that the figures of this species and the one following in *Reeve's Conc. Icon.* should be reversed, fig. 418. representing the shell from *Night Island (Gaertneriana)*, and fig. 419. representing that found at *Port Essington*.

I am the more certain of this, on account of having received during the last month (*February* 1864) from *Mr. McGillivray*, and collected by himself on *Night Island*, a large number of *Helix Gaertneriana*, represented by fig. 418.

On comparing the original descriptions of *H. inconspicua* of *Forbes* and *impexa* of *Reeve* it is evident that two different shells are referred to, and although the name *inconspicua* was previously occupied, it remains a distinct species, consequently I would suggest its being named *H. Having had an opportunity of examining several specimens of this species from the above locality, I may remark that, although Dohrn states the operculum to be normal, it appears to me to differ in form and mode of growth from the circular operculum assigned to the genus *Callia*; the mouth also contributes to furnish sufficient distinctive characters for a new genus.
